

## Word/Number Codes

This question type involves figuring out some codes. You will be given four words, three of which are then written as a number code below. The codes are **not** written in the same order as the words and one of the codes is missing. To answer this type of question, you have to work out which number represents which letter.

Begin by focusing on a number that appears more than once. If this number appears in the same position in two of the codes, you might be able to spot the same pattern with the letters. If not, compare the positions of your chosen letter and see if this is reflected in the codes. Please see the example below.

THAN	PROM	CART	MOAT
2435	6142	5738	

**E1** Find the code for the word **PART**.

- A 6371
B 6317
C 6315
D 6135
E 6215

To solve this, you could look at 3 because 3 is in the same position in two codes. Bear this in mind when looking at the words to find which two words have a third letter that match up. From this, we can conclude that 3 = A but we can also conclude that 6142 is the code for PROM because that is the only word without an A in it. Using this information and decoding the remaining numbers, we know that the answer is 6315 because P = 6, A = 3, R = 1, and T = 5. To mark it on the answer sheet, you put a horizontal line through the corresponding box on your coloured answer sheet like this:

E1	6371	
	6317	
	6315	
	6135	
	6215	

COPE	PIKE	PEAK	CAKE
